

What's New At Amberlea Meadows

2015 was a milestone year at Amberlea Meadows as we completed the construction of our GGT Silica outdoor riding arena. The arena consists of an underground drainage system that vertically collects precipitation and drains it away under the arena. It also has an interlocking matting system that helps to separate the sand layer from the drainage base as well as providing the ring with a shock absorption system. The upper layer is a specialized silica sand combined with a polypropylene fibre called GGT. This riding surface provides state of the art footing with limited shear and utmost stability.

In the past every time it rained during a tournament, we always wished we had a ring that could withstand nature's fury. We have the ring now and look forward to seeing the improvement it will make to the show environment for our competitors.
